

M&A

The traditional methods of assessing the cyber maturity of a seller's organisation are increasingly inadequate in today's complex cyber risk landscape. Typical disclosure methods and questionnaires used to gauge the cyber maturity of the seller's organisation often fall short in accurately assessing an acquirer's current cyber risk profile. Tools designed for third-party risk assessment, when applied in M&A scenarios, fail to provide the acquirer with sufficient assurance that the cyber risks are manageable. Due to these limitations, acquirers often resort to costly insurance policies to protect against unforeseen adverse risks post-acquisition.

From the start to the end of the M&A process, Venari Security provides instant visibility into active cyber campaigns targeting the organisation involved in the merger or acquisition. This approach offers a real-time understanding of the threat landscape. The solution includes active breach detection with continuous monitoring throughout the M&A process. This ongoing vigilance ensures that emerging threats

or vulnerabilities are promptly identified and addressed. By providing detailed insights into the cybersecurity posture of the target organisation, Venari Security enables the buyer to make more informed decisions regarding cyber-related transactional risks. This level of understanding is crucial for a thorough risk assessment in the M&A process.

The Venari Security Solution represents a significant advancement in how enterprises approach cybersecurity risks in mergers and acquisitions. By offering zero-touch visibility, active breach detection, and continuous monitoring, the solution comprehensively empowers acquirers to understand the cyber risks associated with potential transactions. This proactive approach allows for more informed decision-making, reducing the reliance on expensive post-acquisition insurance policies and enhancing the overall security posture of the merged or acquired entity. Adopting the Venari Security Solution is a strategic step towards effectively managing the complex cybersecurity challenges inherent in today's M&A activities.
